CHIRP - Bug # 2019

Status:	Feedback	**Priority:**	Normal
Author:	Calvin Starks	**Category:**	
Created:	11/01/2014	**Assignee:**	Filippi Marco
Updated:	04/09/2019	**Due date:**	
Chirp Version:	0.4.0		
Model affected:	(All models)		
Platform:	MacOS		
Subject:	I can download but can't upload to any of my FT-60's		

Description

I am able to download from all of my radio's and save the image files. I am not able to upload however.

I always start by first downloading from the radio. I then import the data into exact same tab or change the data in the tab. I then try to upload. Weather the radio is connected or not the same error appears. Radio did not respond.

I am using a Keyspan USA-19HS USB to serial adapter. It has a Texas Instruments chipset. Someone else posted in the forums that it was a good adapter. I actually have two of these adapters. I use these adapters to program Fanuc controlled machines at work and also to console into my cisco switches without any issues. I also use them to control my Yaesu FT-897D. I just realized I have not tried it since installing Chirp and associated software. But I have tried both adapters with my FT-60s.

The drivers for the keyspan adapter appear when running the suggested terminal commands.

I'm anxious to use this app and greatly appreciate your efforts. Thanks:)

I'm running OS 10.8.5. I have downloaded the latest build several times just to be extra sure.

Hi Calvin

this seems to be related to other issue we had on MacOS.

Please download a fresh daily version of Chirp and try the solution I suggested for issue #1715 in note 16
I'm confident it can solve your problem.

Let me know your testing results.

#3 - 11/14/2014 06:59 am - Calvin Starks

I downloaded the latest build (chirp-daily-20141112.app). Copied the files into the .app directory replacing the other files as you specified and tried to launch it. It did not even launch. I unzipped another copy and replaced the one I had modified and tested again to be sure it launched. Copied the files into the new chirp app and tried to launch it again. Again the app would not launch. The window flashes as though it's going to launch, but it never makes the new window.

I took a look at the file permissions. It looked as though they were set to 766 (I could be wrong. I never did quite get that remembered). I ran a chmod on the app and changed it to 777 and tried to launch again. No change.

I ran a command that someone had posted in another post to get the chirp log, but I didn't get one. This was last night now, but I think all the command did was cp the log to your desktop. So I looked in the console to see if there weren't really any log entries there either. Here they are though...

Here we are, sorry for long delay.

I checked once again and I confirm the two py file should work.
Please check the sizes of the downloaded files: they should be mainapp.py (66.8 kB) and clone.py (8.7 kB)
As I wrote in the #1715:

> you can't imagine how many time I felt on this my self: I suppose you choose "save link as" on ft817.py link directly from issue page.
>
> Please instead follow the link, it will take you to a page showing the file content with the right "download" link.

tnx for collaboration

I did as you said and downloaded the file itself. I must have missed it the first time. Chirp does launch now. I'll try tonight to see if I can upload to a radio.

Thanks!

cal:)

Now when I go to download from the radio, the buttons where you click "OK" or "Cancel" are broken. You can click ok, or cancel all day long and nothing happens. The associated key strokes (esc) works, but not the enter/return key.

I've uploaded a screen shot of the dialog box I'm talking about.

#7 - 12/10/2014 04:21 am - Filippi Marco

I'm sorry, I must have lost my magical touch ;)
I'll try to find a Mac to prepare a complete package for you to try.

#8 - 12/29/2014 02:31 am - Filippi Marco
- File clone.py added
- File mainapp.py added

Here I am!
I finally have a Mac to test with.
There was an error in download dialog.

I'm adding to this issue updated mainapp.py and clone.py, once again please download both, replace in current daily app and try.

Waiting for your feedback ...

#9 - 04/09/2019 08:05 am - M T

I have tested recently with a Mac, Chirp (installed from brew, updated as of a week ago), and a USB-57A cable from RT Systems and can verify I've had little trouble uploading to the radio. (Sometimes it takes a few attempts.) Maybe this issue can be closed?
