

CHIRP - Bug # 2301

Status:	New	Priority:	High
Author:	Speed Racer	Category:	
Created:	02/07/2015	Assignee:	
Updated:	02/07/2015	Due date:	
Chirp Version:	0.4.0		
Model affected:	BF-888s		
Platform:	MacOS		
Subject:	OS X Freezes between walkie swaps		
Description			
<p>For some reason the system will freeze while working on multiple walkie's (or just un-plugging to check that the changes took effect.)</p> <p>The only way to get the program to work after that is to reboot the computer. However, once this happens, my computer will not ever reboot, unless done manually. It is as if there is a port or something open that cannot be closed. If I could find a way to do this manually I would, but I am not a OS X expert.</p>
