| <b>Description</b>   |                |                  |        |
| <p>I downloaded the software for the BJ-318 which is also for the bj-218 according to the manufacturer's website.</p> <p>I tried using the manufacturer software and got a read error trying to read the radio and the chirp software doesn't have an option for the bj-218</p> <p>Is the BJ 318 the same internally in terms of the code plug ?</p> <p>Or does a new version of chirp need to be written to be able to read and write the BJ-318 ?</p> <p>I think the cable that I received with the radio is not compatible and the manufacturer of lists the program cable as prolific 2303 and what I have is a generic 232R cable, and even though the drivers are installed and the virtual comport is set up and the software sees the comport I think it's not able to read correctly.</p> <p>I would really like to be able to use the chirp software to see if it can read the radio using this cable before I buy another cable</p> |                |                  |        |

### History

- Status changed from New to Feedback

The BG-218 is supported by CHIRP. If the BJ-318 uses the same factory programming software, then the BJ-318 should be supported by CHIRP (just use the BJ-218 model selection). The only person that would know if the BJ-318 code plug is the same as the one for a BJ-218 would be someone with a BJ-318. Read the radio with CHIRP and look to see if the downloaded channels and settings make sense.

Also, no programming software will work until the user supplies a working connection between the computer and radio.
